NON-PUBLIC WATER SUPPLY WELLS

Purpose

To protect the health, welfare and safety of the residents of Linn County by protecting groundwater supplies from contamination by regulating the location of and establishing minimum standards and methods for construction, rehabilitation and reconstruction for nonpublic water supply wells, by requiring permits and providing for permit fees and by establishing penalties for the violations of the provisions contained herein.

23.1. Applicability

The provisions contained herein apply to all nonpublic water supply wells located in Linn County, Iowa, and constructed for the purpose of domestic, livestock, irrigation, recreation, and commercial or industrial use, for which a construction permit is issued after the effective date of this Ordinance. They shall also apply to existing water wells for which well services permits are issued for rehabilitation or reconstruction after the effective date of this Ordinance.

Ponds and surface water supplies are not covered by these standards. Information regarding use of these sources of water should be sought from the administrative authority prior to the development of the sources.

23.2. Definitions

"Abandoned well" means a well whose use has been permanently discontinued. A well shall be considered abandoned when its condition is such that continued use is impractical or no longer desired.

"Administrative authority" means the Linn County Board of Health or its designee, the Linn County Health Department Environmental Division.

"Anaerobic lagoon" means an impoundment, the primary function of which is to store and stabilize organic wastes. The impoundment is designed to receive wastes on a regular basis, and the design waste loading rates are such that the predominant biological activity in the impoundment will be anaerobic. An anaerobic lagoon does not include:

1. A runoff control basin which collects and stores only precipitation-induced runoff from an open feedlot feeding operation; or
2. A waste slurry storage basin which receives waste discharges from confinement feeding operations and which is designed for complete removal of accumulated wastes from the basin at least semiannually; or
3. Any anaerobic treatment system which includes collection and treatment facilities for all off-gases.

"Annular space" means the open space between the well hole excavation and the well casing.

"Cesspool" means a covered excavation, lined or unlined, into which wastes from toilets or urinals are discharged for disposal. Cesspools are not an approved method of sewage disposal.

"Compensation for well interference" means payment to the owner of a

nonregulated well for damages caused by a lowered water level in the well due to withdrawal of water for a permitted use.

"Confinement building" means a building used in conjunction with a confinement feeding operation to house animals.

"Conforming well" means a well that complies with the standards of this chapter, including wells properly plugged according to 567 IAC Chapter 39.

"Deep well" means a well located and constructed in such a manner that there is a continuous layer of low permeability soil or rock at least 5 feet thick located at least 25 feet below the normal ground surface and above the aquifer from which water is to be drawn.

"Earthen manure storage basin" means an earthen cavity, either covered or uncovered, which, on a regular basis, receives waste discharges from a confinement feeding operation if accumulated wastes from the basin are completely removed at least once each year.

"Established grade" means the permanent point of contact of the ground to artificial surface with the casing or curbing of the well.

"Formed manure storage structure" means a structure, either covered or uncovered, used to store manure from a confinement feeding operation, which has walls and a floor constructed of concrete, concrete block, wood, steel, or similar materials. Similar materials may include, but are not limited to, plastic, rubber, fiberglass, or other synthetic materials. Materials used in a formed manure storage structure shall have the structural integrity to withstand expected internal and external load pressures.

"Grout" means a material used to seal the annular space between the casing and the borehole and shall consist of neat cement, concrete, high solids bentonite slurry, or hydrated bentonite chips.

"Health-related problem" means well water that contains any contaminant at a level that exceeds MCLs (maximum contaminant levels), or HALs (health advisory levels) as adopted by the department of natural resources.

"Heavy drilling fluid" means water used for drilling which because of the natural clay content of the borehole or by addition of bentonite grout has a solids density of at least 10 percent by weight or a mud weight of at least 9.25 lb/gal.

"IAC" means the Iowa Administrative Code.

"Low permeability material" means a geological unit of unconsolidated material (usually clay or till) or bedrock (usually shale) that is all or partially saturated, and having permeability low enough (10^{-7} cm/sec) to give water in the aquifer artesian head.

"Nonpublic water supply well" means a well that does not supply a public water supply system.

"Nonregulated well" means a well used to supply water for a nonregulated use (a use of water less than 25,000 gallons per day which is not required to have a water use permit).

"Open feedlot" means an unroofed or partially roofed animal feeding operation in which no crop, vegetation, or forage growth or residue cover is maintained during the period that animals are confined in the operation.

"Permitted use" means a use of water in excess of 25,000 gallons per day which requires a water use permit pursuant to 567 IAC Chapters 50 through 52 and Iowa Code chapter 455B, division III, part 4.

"Pitless adapter" means a device designed for attachment to one or more openings through a well casing. It shall be constructed so as to prevent the entrance of

contaminants into the well through such openings, conduct water from the well, protect the water from freezing or extremes of temperature, and provide access to water system parts within the well.

“Pitless unit” means an assembly which extends the upper end of the well casing to above grade. It shall be constructed so as to prevent the entrance of contaminants into the well, conduct water from the well, and protect the water from freezing or extremes of temperature, and shall provide full access to the well and to water system parts within the well. It shall provide a pitless well cap for the top terminal of the well.

"Public water supply" means a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days out of the year. The term includes (1) any collection, treatment, storage, and distribution facilities under control of the supplier of water and used primarily in connection with the system; and (2) any collection (including wells) or pretreatment storage facilities not under the control of the supplier which are used primarily in connection with the system.

"Pumps and pumping equipment" means any equipment or materials, including seals, tanks, fittings and controls utilized or intended for use in withdrawing or obtaining water for any use.

"Rehabilitation or reconstruction" means modifying the original construction of a well. Rehabilitation or reconstruction includes, but is not limited to, deepening the well, installing a liner, installing or replacing a screen with one of a different diameter or length, installing a pitless adapter, extending the casing, or hydrofracturing a well. Replacing a screen with one of identical diameter and length, replacing a pitless adapter, or acidizing a well would be considered repair, not rehabilitation or reconstruction.

"Runoff control basin" means an impoundment designed and operated to collect and store runoff from an open feedlot.

“Shallow well” means a well located and constructed in such a manner that there is not a continuous layer of low permeability soil or rock (or equivalent retarding mechanism acceptable to the department) at least 5 feet thick, the top of which is located at least 25 feet below the normal ground surface and above the aquifer from which water is to be drawn.

"Stuffing box" means an approved receptacle in which packing may be compressed to form a watertight or airtight junction between two objects.

"Well" means any excavation that is drilled, cored, driven, dug, bored, augered, jetted, washed or is otherwise constructed for the purpose of exploring for groundwater, monitoring groundwater, utilizing the geothermal properties of the ground, or extracting water from or injecting water into the aquifer. “Well” does not include an open ditch, drain tiles, an excavation made for obtaining or prospecting for oil, natural gas, minerals, or products mined or quarried, lateral geothermal heat exchange systems less than 20 feet deep, nor temporary dewatering wells such as those used during the construction of subsurface facilities only for the duration of the construction.

“Well liner” means a pipe used to line the inside of a well hole but not designed to hold hydraulic or structural loading. Liners must be installed within a casing or in an ungrouted open bore hole.

"Well seal" means a device used to cover or seal a well that establishes or maintains a junction between the casing of the well and the piping, electric conduit or equipment installed, so as to prevent water or other foreign material from entering the well at the uppermost terminal.

1. "Well cap" means a snug-fitting, watertight device used above flood level that excludes dust and vermin and allows for screened venting.

2. "Sanitary seal" means a watertight fitting which uses mechanical compression that is installed on wells that terminate in a well house.

"Well services" means new well construction, well reconstruction, installation of pitless equipment, or well plugging.

23.3. Nonconforming installations

Certified well contractors shall ensure that the rehabilitation or reconstruction of nonconforming wells adheres to all applicable provisions of this Ordinance.

When any construction or reconstruction is done on a nonconforming feature of a well, that feature shall be upgraded and brought into compliance with the material and installation standards contained in this Ordinance.

23.4. Variances

Variances to the provisions of this Ordinance may be granted by the administrative authority if sufficient information is provided to substantiate equal protection and the need for such action. Variance requests and reasoning shall be in writing. Variance approvals or rejections shall also be in writing.

23.5. Exemptions

The provisions of this Ordinance shall not apply to public water supply wells, horizontal heat pump installations, elevator shafts, underground storage tank monitoring wells as covered under 567 IAC Chapter 135, or monitoring wells for solid waste disposal facilities as covered in 567 IAC Chapter 110.

23.6. Permits required / Inspections Authorized

No well services shall be initiated until a permit has been issued. Application shall be made on forms provided by the administrative authority under rules promulgated by the administrative authority. Applications shall be submitted to the administrative authority along with the required fee. The administrative authority may also require posting of performance bonds and collection and submission of other data. All well services shall be performed by a certified well contractor or the property owner as specified in 567 IAC Chapter 82.

It shall be the responsibility of the certified well contractor to ensure that a well construction permit has been issued prior to initiation of well services. It shall also be the responsibility of the certified well contractor to ensure that all well services are performed in accordance with the provisions of this Ordinance.

The administrative authority shall have the authority to visit well sites and perform inspections during any phase of the work without prior notice. The administrative authority shall require the issuance of permits and the submission of water well logs.

23.6.1. Grouting Inspection. No wells subject to the provisions of this Ordinance shall be grouted or so constructed so as to deny inspection by the administrative authority. A request for grouting inspection shall be made to the administrative authority between the hours of 8:00 a.m. and 5:00 p.m., Monday through Friday and at other times by appointment. Grouting may be commenced if inspection personnel are not available within 20 minutes of the requested time for grouting.

Whenever the administrative authority has reasonable grounds to believe that a violation of this provision has occurred, it may enter upon and make an inspection of such premises, dwelling or other building, and gather other necessary information, including water samples or other necessary specimens for the purpose of laboratory analysis.

23.6.2. Fees. Fees to be collected by the administrative authority for permits and any other services necessary for carrying out the provisions of this Ordinance shall be set by resolution of the Board of Supervisors.

23.7. Location of wells

Wells shall be located with consideration given to the lot size, contour, porosity and absorbency of the soil, local groundwater conditions, flooding, and other factors necessary to implement the rules contained in this Ordinance. The lack of specific distances to other possible sources of contamination, such as refuse disposal sites and high-pressure gas lines, does not minimize their potential hazard. These must be evaluated in each particular situation and a distance arrived at that is based on pertinent facts. The well contractor shall consult the administrative authority for assistance in determining a proper distance in such cases.

23.7.1. Minimum lateral distances The following minimum lateral distances shall apply for the common sources of contamination listed in the following table.

Table 23.7.1.

Minimum lateral distances		
Sources of Contamination	Minimum Lateral Distance (feet)	
	Shallow Well	Deep Well
Formed manure storage structure, confinement building, feedlot solids settling facility, open feedlot	200	100
Public water supply well	400	200
	<u>All Wells</u>	
Earthen manure storage basin, runoff control basins and anaerobic lagoons (see §23.7.2. below)	1000	
Domestic wastewater lagoon	400	
Sanitary landfills	1000	
Preparation or storage area for spray materials,		

commercial fertilizers or chemicals that may result in groundwater contamination	100
Drainage wells	1000
Conforming wells	10
Nonconforming wells	100
Soil absorption field, any sewage treatment system with an open discharge, pit privy or septic tank discharge line (not conforming to 567 IAC Chapter 69)	100
Septic tank, concrete vault privy, sewer of tightly joined tile or equivalent material, sewer-connected foundation drain, or sewers under pressure	50
Sewer of cast iron with leaded or mechanical joints, sewer of plastic pipe with glued or compression joints, independent clear water drains, cisterns, well pits, or pump house floor drains	10
Hydrants	10
Property lines (unless a mutual easement is signed and recorded by both parties)	4
Liquid hydrocarbon storage tanks	100
Ditches, streams, ponds, or lakes	25

23.7.2. Exception to minimum lateral distances The minimum separation distance between a well and an anaerobic lagoon, earthen manure slurry storage basin, earthen manure storage basin, or runoff control basin shall be 400 feet if the lagoon or basin was permitted by the department after January 1, 1989, or if the applicant demonstrates through percolation testing that the seepage loss through the lagoon or basin does not exceed 1/16 inch per day (0.0625 inch/day). The percolation test shall meet the requirements of ASTM-1587 and 567 IAC sub-rule 65.15(11).

23.7.3. Relation to buildings The well shall be located so that no building interferes with reasonable access for cleaning, treatment, repair, testing, inspection and other maintenance. Wells shall not be located in basements.

23.7.4. Easements No well shall be located on a property not owned by the well owner unless an easement allowing such placement is reviewed and approved by the administrative authority and the easement is legally recorded.

23.8. General construction requirements

Wells shall be planned and constructed to adapt to the geologic and groundwater conditions of the proposed well site to ensure reasonable utilization of every natural protection against contamination of the water-bearing formation(s) and the exclusion of possible sources of contamination, to attempt to produce bacterially safe water which is free of health-related problems.

23.8.1. Water used in construction Water used in the construction process shall be obtained from a potable water source that will not result in contamination of the well. Water used for drilling shall be treated with 3 pints of 5.25 percent sodium hypochlorite solution per 100 gallons of water or 0.25 pounds of 65 percent calcium hypochlorite per 100 gallons of water or other additives to produce an equivalent concentration of chlorine residual (50 ppm).

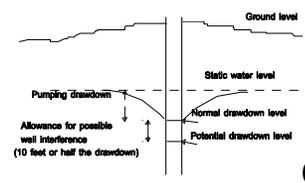

23.8.2. Wellhead The upper terminal casing of all wells shall extend at least 12 inches above established grade or pump house floor, or the 100-year flood level, whichever is higher. A well cap or sanitary seal shall be installed immediately following well completion. A well cap shall be used on an exposed well, a sanitary seal only on a well terminating within a well house. Any openings in the cap or seal, such as for pump wiring or water depth measurement, shall be properly grommeted or sealed except properly screened and oriented vent openings.

The ground surface immediately adjacent to the well casing shall be compacted and graded so that surface water is diverted away from the casing. Well platforms are not recommended other than those used as pump house floors as indicated in §23.13.2.

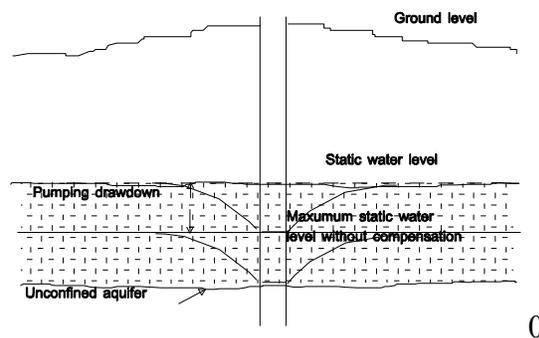

23.8.3. Criteria for well interference protection 567 IAC Chapter 54 provides an administrative process for owners of nonregulated wells to receive compensation for well interference caused by permitted uses. To be eligible for compensation due to well interference, nonregulated wells constructed after July 1, 1986, must be constructed to allow for some potential well interference.

Allowance for potential well interference is accomplished by constructing a nonregulated well to anticipate a lowering of the static head of the well which may be caused by interference from a nearby permitted use well.

a. The well must be drilled deep enough to allow for setting the pump at least 10 feet or half the normal pumping drawdown, whichever is greater, below the initial recommended setting depth.

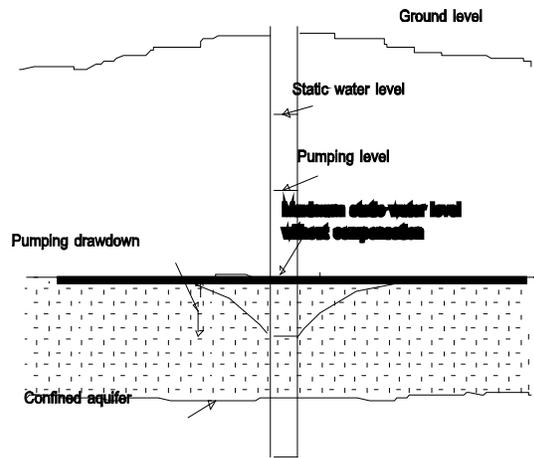

b. If the well draws from an unconfined aquifer, the static water level may drop to half the saturated thickness of the aquifer before well interference is considered, if the calculation in "a" above should indicate a shallower depth. Shallow aquifers that are only slightly confined may be classified as unconfined aquifers for this purpose.

c. Where a well penetrates a confined aquifer, the static water level is protected only to the top of the aquifer if the calculation in "a" above should indicate a deeper level.

d. Protected levels for flowing wells will be considered the top of the confined aquifer or 100 feet below the surface, whichever is higher. Flowing wells must be constructed to accommodate a pump capable of supplying a sufficient water supply at protected levels.

0

The well design also needs to consider drought and reduced well efficiency. (Additional information is contained in 567 IAC Chapter 54.)

A well that is used to withdraw more than 25,000 gallons of water per day requires a water use permit from the Iowa department of natural resources. Upon obtaining such a permit, the well is called a permitted use. If a permitted use exists prior to the construction of a well without a water use permit, no compensation for well interference will be allowed unless a significant change in the permitted use occurs. A physical change to withdrawal facilities may be considered a significant change to a permitted use (e.g., moving the withdrawal location, installing a new well, or installing a higher capacity pump). A person desiring to construct a well not requiring a water use permit should first obtain information concerning nearby permitted use wells. The department of natural resources will provide information on permitted use wells upon request.

23.8.4. Access port for measurement of water levels Permitted use wells shall be equipped with an access port having a minimum diameter of 3/4 inch. The access port shall be fitted with a threaded cap or plug and be located to allow insertion of a steel tape or electric probe into the well for measurement of water levels. When a spool type of pitless adapter is used which obstructs clear access to the water, a 3/4-inch pipe shall be attached to the spool and brought to the surface below the well cap to allow water level measurements. Wells not requiring a water use permit should be constructed with an access port for water level measurement for possible future well interference concerns.

23.8.5. Interconnection of aquifers There may be local confining beds that serve an important protective function. Permitted use wells shall use casing and grouting to maintain a hydraulic separation between distinct aquifers separated by confining intervals. Extreme caution should be exercised in the construction of non-permitted use wells if allowing the well to connect aquifers across confining intervals, particularly in areas where that would open the aquifer to surficial contamination, i.e., in areas where the upper rock unit is unconfined or contains less than 40 feet of unconsolidated materials. The administrative authority shall be consulted for possible local regulations when interconnection of aquifers across confining intervals is anticipated.

23.9. Types of well construction

23.9.1. Drilled wells

a. Drilled wells in unconsolidated materials.

(1) Depth. In no case shall less than 20 feet of permanent casing be installed in wells drilled in unconsolidated materials. If the alluvial aquifer where the water is to be drawn from is covered by less than 40 feet of low permeability materials, the well screen shall be set at the bottom of the water-bearing aquifer or at least 60 feet from the surface. (Deeper depths may be required if nitrate contamination is excessive.) If more than 40 feet of low permeability materials are present above the aquifer, the casing shall extend down at least to the top of the aquifer.

(2) Grouting. Grout shall be placed to a minimum depth of 40 feet or along the full length of the casing where less than 40 feet of casing is set. Grouting the full length of the casing below 40 feet may be necessary to isolate any contaminated water lenses or aquifers. If a layer of low permeability material at least 5 feet thick is encountered less than 40 feet from the surface, the grout may be terminated no less than 5 feet below the top of this low permeability material, but in no case less than 20 feet from the ground surface. Grout must be placed in accordance with §23.10.3., except when driving casing. When driving casing a #8 mesh bentonite or bentonite grout must be maintained around the outside of the casing. The bottom of driven casing must be equipped with a drive shoe.

(3) Annular space. The diameter of the borehole shall be at least 3 inches greater than the outside diameter of the well casing to the minimum grouting depth. When steel well casing pipe is installed using percussion methods, the annular space shall be at least 5 inches greater than the outside diameter of the well casing to a minimum depth of 25 feet.

b. Drilled wells in consolidated material.

(1) Minimum casing depth. Casing shall extend to a depth of at least 40 feet and be seated in firm rock. When the uppermost bedrock consists of creviced limestone or dolomite that does not produce water, the casing shall extend through the creviced formation, be seated in firm rock and be properly grouted.

(2) Grouting. For bedrock wells, full-length grouting of the casing is required. Grout shall be placed to a minimum depth of 40 feet in accordance with §23.10.3., except when driving casing using percussion or casing-hammer/rotary drilling. When driving casing, #8 mesh bentonite or bentonite grout must be maintained around the outside of the casing. The bottom of driven casing must be equipped with a drive shoe. If a layer of low permeability material at least 5 feet thick is encountered less than 40 feet from the surface, the grout may be terminated no less than 5 feet below the top of this low permeability material, but in no case less than 20 feet from the ground surface. Where local conditions warrant, the administrative authority may require more extensive grouting to protect any aquifer(s) that are penetrated.

(3) Annular space. The borehole shall be at least 3 inches greater than the outside diameter of the well casing for the upper 40 feet or the minimum grouting depth. When steel casing pipe is installed using percussion, or casing-hammer/rotary methods, the annular space shall be at least 5 inches greater than the outside diameter of the well casing to a minimum depth of 25 feet. When bedrock wells are full-length pressure-grouted through the casing, the borehole diameter shall be 3-inches larger than the outside diameter of the casing for the minimum depth of at least 25 feet.

(4) In fractured rock, where circulation of slurry cannot be maintained, grouting may be done with bentonite chips. The chips shall be hydrated with one gallon of water per bag of bentonite.

23.9.2. Bored and augered wells in unconsolidated materials For bored or augered wells with concrete or clay tile casings at least 18 inches in diameter, buried-slab construction is required.

a. Casing. The concrete or vitrified clay pipe casing shall be terminated not less than 10 feet below ground surface and extend to a minimum depth of 20 feet. The casing shall be fitted with a reinforced concrete or steel plate into which a watertight steel or thermoplastic casing is firmly imbedded in or connected to a pipe cast or welded into the plate. This casing shall be at least 5 inches in diameter and shall extend from the plate to not less than 12 inches above established grade or the 100-year flood level, whichever is higher. A pitless adaptor shall be installed below frost depth on the newly installed plastic or steel casing.

b. Backfilling annular space. A 12-inch grout seal shall be poured over and around the plate. The annular space between the steel or thermoplastic casing and the borehole shall be backfilled with clean compacted soil free of debris or large organic material. During the backfilling process, the earth shall be thoroughly tamped to minimize settling. Grading around the well shall then be accomplished in accordance with §23.8.2.

23.9.3. Driven and direct push wells Sandpoint wells are typically constructed in sandy areas with a high water table. Groundwater in these areas is often susceptible to contamination. This type of construction is not recommended for potable water supply. Sandpoint wells shall meet the requirements of this chapter except for casing depth and grouting requirements.

23.9.4. Flowing artesian wells Drilling operations shall extend into but not through the formation confining the water. The casing shall then be installed and the annular space full-length pressure-grouted and allowed to set. After allowing the grout to set, the drill hole shall be extended into the confined water-bearing formation. Flow control from the well shall be provided by valved pipe connections or a receiving tank set at an altitude corresponding to that of the artesian head. Under no circumstances shall the water flow uncontrolled to waste. A direct connection between the discharge pipe and a receiving tank, sewer, or other source of contamination is prohibited.

23.10. Material standards

All materials utilized in well water construction shall conform to the standards of the American Water Works Association (AWWA), the American Petroleum Institute (API), the American Society for Testing and Materials (ASTM), and the National Ground Water Association (NGWA) except as modified by these standards.

23.10.1. Water well casing

a. Steel well casing and couplings.

(1) Steel well casing pipe shall have the dimensions and weights specified in Table 23.10.1.(a). Well casing pipe shall be new steel pipe meeting one of the following standards:

1. ASTM A 53-96,
2. ASTM A 106-95,
3. ASTM A 589-95a - Type I, II or III,
4. API 5CT (5th Edition, 4/1/95),

5. API 5D (3rd Edition, 8/1/92), or
6. API 5L (41st Edition, 4/1/95).

(Copies of these standards are available for inspection at the Des Moines office of the department of natural resources records center or may be obtained for personal use from the American Society for Testing and Materials, 100 Barr Harbor Drive, West Conshohocken, Pennsylvania 19428-2959, or the American Petroleum Institute, 1220 L Street NW, Washington, DC 20005.)

(2) Each length of casing shall be legibly marked in accordance with API or ASTM marking specifications showing the manufacturer's or processor's name or trademark, size in inches, weight in pounds per foot, whether seamless or welded (type of weld) and the API or ASTM specification or trade monogram.

(3) All casing pipe joints shall be watertight welded construction or threaded couplings.

(4) Minimum casing pipe and coupling weights and dimensions are as follows:

Table 23.10.1(a)

Minimum casing pipe and coupling weights and dimensions

Size (inches)	Weight (lbs/ft)		Pipe				Couplings	
	Threads & Coupling	Plain End	Thicknes s (inches)	External Diameter (inches)	Internal Diameter (inches)	Threads per inch	External Diameter (inches)	Length (inches)
1	1.70	1.68	.133	1.315	1.049	11-1/2	1.576	2 - 5/8
1-1/4	2.30	2.27	.140	1.660	1.380	11-1/2	1.900	2 - 3/4
1-1/2	2.75	2.72	.145	1.900	1.610	11-1/2	2.200	2 - 3/4
2	3.75	3.65	.154	2.375	2.067	11-1/2	2.750	2 - 7/8
2-1/2	5.90	5.79	.203	2.875	2.469	8	3.250	3-15/16

20 OD	81.00	78.60	.375	20.000	19.250	8	21.000	7-5/8

R = Round Threads

b. Thermoplastic casing and couplings

(1) Materials. Thermoplastic well casing pipe and couplings shall be new polyvinyl chloride (PVC) or acrylonitrile-butadiene-styrene (ABS) material produced to and meeting the ASTM F 480 standard and shall have a standard dimension ratio (SDR) of 21, 17, or 13.5, a dimension ratio (DR) of 18 or 14, or a schedule 40 or 80 rating

depending upon the specification. Styrene-rubber thermoplastic well casing pipe, including ASTM F 480, may not be used.

(2) Potable water standards. The thermoplastic well casing pipe, pipe couplings, cement, primer and other components used shall be approved for well casing pipe in potable water supplies by the NSF Standard Number 61 or the health effects portion of Standard Number 14 as they relate to well casing pipe, or an approved equivalent organization.

(3) Markings. Each length of casing shall be legibly marked showing the manufacturer's or processor's name or trademark, size in inches, and the ASTM F 480 specification or trade monogram.

(4) Casing joints. The thermoplastic pipe shall be assembled with either flush-threaded joints, integral-bell, solvent-cemented joints, one-piece solvent-cemented couplings or nonmetallic restrained joint system in a manner according to the specifications in ASTM F 480.

(5) Hydraulic collapse pressure for plastic casing. The following table provides specifications for maximum hydraulic collapse pressure (in feet of water head) to which PVC well casing of different strengths can be installed.

Table 23.10.1(b)

SIZE	PVC WELL CASING						
	Maximum Hydraulic Loading (in feet of water head) ⁽¹⁾						
	ASTM F 480 or ASTM 2241		C-900		ASTM 1785		
	SDR 21	SDR 17	SDR 13.5	DR 18	DR 14	SCH. 40	SCH. 80
4"	257'	496'	1,024'	--	--	353'	1,055'
4½"	257'	496'	1,024'	--	--	--	--
5"	257'	496'	1,024'	--	--	236'	758'
6"	257'	496'	1,024'	490'	956'	177'	678'
8"	257'	496'	1,024'	490'	956'	121'	471'
10"	257'	496'	1,024'	490'	956'	90'	404'
12"	257'	496'	1,024'	490'	956'	74'	376'
16"	257'	496'	1,024'	490'	956'	70'	350'

⁽¹⁾ Determined by formulae in ASTM F 480 with Poisson's ratio of .38

(6) When cement grout is used with thermoplastic casing, the manufacturer's specifications for use shall be followed except in the top 40 feet.

(7) Thermoplastic pipe extending above ground shall be protected from ultraviolet light exposure.

(8) Under no circumstances shall thermoplastic water well casing be driven.

23.10.2. Grouting guides Casing that is to be grouted shall have a minimum of two sets of centering guides attached to the casing so as to permit the unobstructed flow and deposition of grout.

23.10.3. Grouting Materials and procedures for grouting shall be as follows:

a. Concrete grout. The mixture, used with bored and augered wells, shall consist of cement, sand aggregate and water, in the proportion of one bag cement (94 lbs.) and an

equal volume of aggregate to not more than six gallons of clean water. Concrete grout shall not be used below the water table. Admixtures to reduce permeability or control setting time must meet ASTM Standard C 494-92. Concrete grout may be used with permission of the administrative authority where large void spaces need to be filled.

b. Neat cement grout. The mixture shall consist of one bag of cement (94 lbs.) to not more than six gallons of clean water. Admixtures to reduce permeability or control setting time must meet ASTM Standard C 494-92.

c. Bentonite grout. This is a mixture of water and commercial sodium-bentonite clay manufactured for the purpose of water well grouting. Mixing shall be per manufacturer's specifications. Sodium-bentonite mixtures that have high viscosity but contain less than 10 per cent solids, are designed for drilling purposes, and shall not be used as grout. Organic polymers used in grout mixtures must meet NSF Standard 60.

d. Exclusion. Drilling fluids and cuttings may not be used as grouting material to satisfy the minimum grouting requirements.

e. Application. Grouting shall be performed by pumping the mixture into the annular space from the bottom upward through the casing or through a tremie pipe until the annular space is filled. Grouting shall be done in one continuous operation, if possible. The bottom of the tremie pipe must remain submerged in grout while grouting.

f. Exceptions. The exceptions to this method of application are the use of buried-slab, percussion, or casing-hammer/rotary methods to construct a well. The proper grouting methods for these types of wells are specified in §23.9.1. and §23.9.2. Another exception is where dry bentonite is required because circulation cannot be maintained as described in §23.9.1.(b)(5).

23.10.4. Pitless adapters and pitless units

a. Pitless adapters and pitless units conforming to Pitless Adapter Standard - 97 as promulgated by the Water Systems Council are considered as complying with these regulations. A copy of this standard is available for inspection at the Des Moines office of the department of natural resources records center or may be obtained for personal use from the Pitless Adapter Division, Water Systems Council, 800 Roosevelt Road, Bldg. C, Suite 20, Glen Ellyn, Illinois 60137.

b. A pitless subsurface pipe connection to a well casing pipe shall be made with a weld-on, clamp-on, or bolt-on pitless adapter or weld-on or threaded pitless unit. Above-ground discharge pitless adapters are prohibited.

c. Grouting pitless adapters and pitless units. After connecting a pitless adapter or unit, the area surrounding the unit must be uniformly filled with dry bentonite.

d. If the pitless adapter is gasketed, the opening in the casing shall be sawed, to the diameter recommended by the manufacturer, with a hole saw and not cut with a torch. The pitless adapter used shall have the correct curvature to fit the diameter of the casing.

23.11. Rehabilitation or reconstruction

All well rehabilitation or reconstruction must meet the requirements of this chapter. If the well feature needing rehabilitation/reconstruction cannot be brought into compliance with these rules, the well must be properly plugged.

23.11.1. Installing a liner If the rehabilitation/reconstruction will involve the placement of a liner, the certified well contractor must then determine whether the proposed rehabilitation/reconstruction is to be done to correct a health-related problem.

The work to be performed must then be done in accordance with paragraph "a" or "b" below.

- a. Standards for installation of a liner to correct a health-related problem.
 - (1) The liner shall have a minimum of two sets of centering guides to allow the proper placement of grout. In no case shall the liner be driven into place.
 - (2) The liner shall extend to the ground surface or top of the pitless adapter.
 - (3) The annular space between the old casing and the liner shall be pressure-grouted in place throughout its entire length using an approved grout.
- b. Standards for installation of a liner to correct a problem that is not health related.
 - (1) The liner shall extend at least ten feet above the static water level or, if a caving zone is present, shall extend above this region.
 - (2) The liner may be pressure grouted in place if there is a sufficient annular space for proper application of the grout.
- c. Liner material standards. Liners must meet well casing standards as defined in §23.10.1. Liners may be composed of either steel or thermoplastic with a minimum inside diameter of 4 inches. Steel liners must be new and have a minimum wall thickness of .188 inches. Plastic liners must have a standard dimension ratio of 26 or less or a schedule rating of SCH 40 or SCH 80. If the installation does not meet the definition of a liner, then casing material shall be used.

23.11.2. Reserved

23.12. Disposal of drilling mud

Drilling fluid and mud remaining after construction of a well shall not be disposed of in a steam or storm sewer nor shall these materials be discharged into a sanitary sewer without permission of the owner and operator of the wastewater treatment facility.

23.13. Water distribution systems

23.13.1. Pumphouse appurtenances When pump houses are utilized, they shall be constructed above established grade permitting access to the well and pump for maintenance and repair. The pump room shall be provided with an independent floor drain that discharges to ground surface. The outside opening of this drain line shall be fitted with a brass, bronze or copper 16-mesh screen to exclude the entrance of pests.

23.13.2. Pumphouse floors The top of the well casing shall terminate at least 12 inches above the pumphouse floor. The pumphouse floor shall be constructed of concrete that is not less than 4 inches in thickness and is sloped away from the casing. A watertight seal to provide resiliency shall be provided between the casing and the pumphouse floor.

23.13.3. Frost pits Wells are not permitted to be located within frost pits. Frost pits that do not contain wells within are permitted for the purpose of housing pressure tanks and valves, for example, provided they are not located closer than ten feet from any well. Frost pits shall be constructed so as to be weatherproof and vermin-proof and an independent floor drain or a sump pump shall be provided.

23.13.4. Pumps and pumping equipment

- a. General pump installation requirements. The installation of pumps shall be

planned and carried out so the pump will be:

- (1) Installed so that it and its surroundings are in a sanitary condition;
- (2) Properly sized so as to provide the volume of water necessary, where obtainable, for an adequate water supply;
- (3) Designed to meet the well characteristics and not exceed the yield of the well except when the available aquifer is low producing;
- (4) Installed for operation without priming or breaking suction;
- (5) Installed in such manner as to provide adequate protection against contamination of the water supply from any surface or subsurface sources;
- (6) Installed in a manner so that it is accessible for maintenance, repair, and removal.

b. Lubrication. Pump motor lubricant or coolant oil shall be USDA- or FDA-approved food contact grade formulations.

c. Well/pump discharge. Every pump shall be installed with an above-ground discharge, an approved subsurface pitless adapter or pitless unit, or an approved subsurface well casing pipe connection.

d. Other power pumps. Other power pumps located over the well shall be mechanically joined to the casing or on a pump foundation or stand in such a manner as to effectively seal the top of the well. A sanitary seal shall be used where the pump is not located over the well, and the pump delivery or suction pipe emerges from the top. If these units are located in a basement, all suction lines shall be elevated at least 12 inches above the floor and shall be encased in a protective galvanized steel pipe.

e. Hand pumps or similar devices. A hand pump, hand pump head, stand, or similar device must have a closed and screened spout, directed downward. The pump must have a concrete slab at least 4 inches thick extending horizontally at least 1 foot in every direction from the well casing and sloped to divert water away from the casing. A watertight seal must be provided between the casing and the slab. A reciprocating pump rod must operate through a stuffing box.

f. Well disinfection after pump installation or repair. Wells must be properly disinfected by the pump installer as described in §23.14 after the installation or repair of pumps.

g. Interconnections and cross connections. No connection between a well or boring and another well, boring, water supply system, or contamination source is allowed unless the connection is:

- (1) Protected by an air gap;
- (2) Protected by a backflow prevention device; or,
- (3) Between wells or borings that meet the construction standards of this chapter, are used for the same purpose, and have equivalent quality water supply.

23.13.5. Hydropneumatic (pressure) tanks Pressure tanks should be sized by pump capacity and expected usage. They must be installed in accordance with manufacturers' directions and shall maintain a pressure of at least 15 pounds at highest point usage under normal demand.

23.13.6. Filters and water treatment equipment Filters and water treatment equipment shall be installed and operated in accordance with manufacturers' directions.

23.14. Well disinfection

All new, repaired or rehabilitated wells shall be pumped to waste until the

water is free of drilling mud, drill cuttings and sand, and the water is reasonably clear.

Wells shall be disinfected by the contractor following completion of construction and whenever the well seal or cap is removed and work is done within the casing. A chlorine solution such as a sodium or calcium hypochlorite shall be used. Chlorine compounds having special additives shall not be used.

a. The disinfectant shall be dispersed throughout the entire water column in the well. The disinfectant shall also be brought into contact with the inside of the well casing pipe above the static water level.

b. The disinfectant shall remain in the well for a minimum of two hours if a concentration of at least 100 mg/l chlorine is achieved, or a minimum of twenty four hours if at least 50 mg/l is achieved

c. For emergency situations, a contact time of a minimum of thirty minutes shall be provided at a chlorine concentration of at least 200 mg/l.

d. The amount of HTH or household bleach required for a chlorine concentration of 200 mg/l is given in the following table:

Table 23.14.(d)

Amount of chlorine disinfectant required for every 25 feet of water in well

Well casing diameter (in inches)	4"	6"	8"	12"	18"	24"	30"	36"
Amount of pelleted HTH (in ounces containing ~70 percent Ca(OCl) ₂)	0.7	1.5	2.6	5.6	13	23	36	52
Amount of chlorine bleach (in pints containing 5.25 percent NaOCl)	0.5	1.2	2.1	4.7	10.6	18.8	29.3	42.2

e. The disinfectant shall be introduced into the well in a solution of disinfectant and water. The solution shall contain not more than eight ounces of disinfectant per five gallons of water. In no case shall pressed pellets of disinfectant, when used for shock chlorination, be introduced directly into the well without first being dissolved.

23.15. Water sampling and analysis

a. In all pressure water systems, provision shall be made for collection of water samples directly from the well by installation of a sampling faucet before the pressure tank, and prior to encountering any water treatment equipment. The sampling faucet shall be installed at least 12 inches above the floor, have a downturned spout and be in an accessible location. All sample faucets shall be metal and have a smooth (nonthreaded) outlet .

b. The owner of a new, repaired, or rehabilitated well shall be responsible for submitting a water sample to a certified laboratory for coliform bacteria and nitrate analysis. The water sample shall be collected at least 10 days and not more than 30 days after a well is put into service following the construction, repair, or rehabilitation. The analysis results shall be submitted to the administrative authority.

c. If the water sample analysis detects presence of bacteria, the disinfection procedure described in §23.14 shall be repeated.

23.16. Abandonment of wells

Abandoned wells are a contamination hazard to the water bearing formation as well as a physical hazard for people.

23.16.1 Plugging rules Abandoned wells shall be properly plugged as required by Chapter 22, Linn County Code of Ordinances.

23.16.2. Waste disposal prohibition Under no circumstances shall abandoned wells be used for the disposal of debris, solid waste, septic tank sludge or effluents, or for any other type of unauthorized disposal of waste materials, or as a receptacle for field tile drainage.

23.17. Closed circuit vertical heat exchangers

These provisions apply to closed circuit vertical heat exchanger construction.

- a. Piping used must be 160 psi pressure-rated high-density polyethylene or polybutylene.
- b. Connection to piping must use socket fusion or butt fusion joining methods.
- c. Piping must be pressure-tested with air or potable water for 15 minutes at a pressure of 1.5 times the system operating pressure after installation in the borehole.
- d. The annular space between the vertical heat exchanger piping and the borehole must be grouted as required in §23.10.3. using an approved grouting method and material. Grout shall be placed at least in the top 40 feet. Any confining layers between aquifers shall be replaced with grout. Grouting must be performed within 24 hours of completion of the borehole.
- e. Only food-grade or USP-grade propylene glycol or calcium chloride may be used as heat transfer fluid. Any other materials or additives must be NSF-approved for drinking water applications. A permanent sign must be attached to the heat pump specifying that only approved heat transfer fluids must be used.
- f. A flow measurement device must be installed on each system.
- g. Water make-up lines to the vertical heat exchanger must be protected with a backflow prevention device.

23.18. Conflict with State laws

This Ordinance is intended to be consistent with State law. In the event that this Ordinance conflicts with a State law or a State Administrative Code rule, the more stringent standards shall be controlling.

23.19. Jurisdiction

The provisions of this Ordinance shall apply throughout Linn County, Iowa.

23.20. Enforcement

It shall be the duty of the Linn County Health Department Environmental Division to enforce the provisions of this Ordinance. The Department shall have the authority to visit well sites during any phase of the work in progress without prior notice.

23.21. Penalty

A violation of any of the requirements of this Ordinance are subject to the following penalties:

a. A violation of any provision of this Ordinance or any code, rules, or regulations adopted herein by reference shall constitute a County infraction. Any person committing a County infraction shall, upon conviction be subject to a civil penalty of not more than Five Hundred Dollars (\$500) for each offense, not to exceed Seven Hundred and Fifty Dollars (\$750) for each repeat offense. Each day that a violation occurs or is permitted to exist by the violator shall constitute a separate offense. A list of scheduled offenses and their respective penalties may be adopted by resolution of the Board of Supervisors.

b. The citation for a County infraction may be served by personal service or by certified mail return receipt requested. A copy of the citation shall be retained by the administrative authority and one copy shall be sent to the clerk of the district court.

c. A person found guilty of a County infraction is liable for the court costs and fees.

d. In addition to any civil penalty imposed for violation of this Ordinance, the court may grant appropriate relief to abate or halt the violation.

e. If a violator willfully fails to pay the civil penalty or violates the terms of any other order imposed by the court, such failure shall constitute contempt.

f. Notwithstanding the provisions of §§23.21(a) and 23.21(d) any person found guilty of a violation of any of the provisions of this Ordinance may be subject to a criminal penalty not to exceed a One Hundred Dollar (\$100) fine or thirty (30) days in jail. Each day that a violation occurs or is permitted to exist by the violator shall constitute a separate offense.

g. The provisions of this Ordinance shall not preclude the bringing of a civil action by ordinary proceedings to enjoin or abate any nuisance.

h. Nothing herein shall preclude the Department of Natural Resources administration's right of enforcement under §455B, Code of Iowa.

23.22. Separability of provisions

The provisions of this Ordinance are separable, and if any provision, sentence, clause, section, or part thereof should be held illegal, invalid, unconstitutional or inapplicable to any person or circumstances, such illegality, invalidity, unconstitutionality or inapplicability shall not affect or impair any of the remaining provisions, sentences, clauses, sections, or parts of the Ordinance.

23.23. Effective date

Upon passage, this Ordinance shall take effect October 1, 1999 or upon date of publication, whichever date occurs later.
